A: I think the issue is that you're interpreting your string as UTF-8 instead of UTF-16, and you are converting that as if it was a UTF-8 encoded string. UTF-8 decoding on a UTF-16 encoded string is not well defined, and in this

---

case your string probably isn't valid UTF-8. The string you have in your question isn't valid UTF-16, which is even more reason to not decode it as such.

1. Field of the Invention This invention relates to a power cable connector assembly, more particularly to a cable connector assembly with a latch member that easily and reliably latches the electrical connection device and the power cable together.

2. Description of the Related Art An electrical power connector to connect an electrical cable and a corresponding electrical connection device such as a plug connector is commonly used in a computer system, a peripheral equipment, or the like. A conventional cable connector has a connector body and a metallic retainer mounted on the connector body to fix a power cable therein. The connector body has a base portion, a plurality of terminals extending upwardly from the base portion and a cable receiving space for receiving the power cable. The retainer defines a plurality of connecting portions protruding upwardly from a bottom wall thereof and engaging with the connector body. The cable receiving space has a rear end, a cable entrance and a connecting portion extending from the cable entrance for connecting to the power cable. The connecting portion has two opposing walls spaced apart a distance greater than the thickness of the power cable. The wall with a smaller thickness provides a space for the power cable to insert into and the wall with the greater thickness makes the power cable tightly engageable to the connecting portion. During the connecting process, firstly, the power cable is inserted into the cable entrance and pushed upwardly through

---

the cable entrance and connecting portion until the plug connector is positioned above the power cable, and the plug connector is then pushed into the cable receiving space until the plug connector engages the opposing walls of the connecting portion. Next, the retainer is moved downwardly to press the plug connector against the opposing walls of the connecting portion, and the connector is then pushed into the connector body. The power cable is firmly latched to the cable connector. In the conventional cable connector assembly, the power cable is forcibly driven into the connecting portion of the cable connector by the retainer to make the power cable tightly engageable to the connecting portion of the cable connector. Thus, the power cable
